

Football Analytics & Community API

API Documentation

Module

COMP3011 – Software Engineering Principles

Project

Football Analytics & Community REST API

Student

202049082 Hany Song

Version

1.0

1. Overview

This document describes the REST API developed for the COMP3011 coursework project.

The API provides two main domains of functionality:

1. **Football analytics data**
2. **Community discussion features**

The football component allows users to explore teams, players, matches, and statistical analytics such as top scorers, assists, and league standings. The community component enables registered users to create posts, comment on discussions, and interact through a like system.

The system is implemented using **Django REST Framework** and exposes a RESTful API designed to support both analytical queries and community interaction.

The API supports:

- browsing football teams, players, and matches
- player and team analytics
- league standings computation
- community posts and comments
- user authentication and profile management
- like functionality for posts and comments
- pagination and filtering

The detailed endpoint specification included in this document is automatically generated from the OpenAPI schema.

2. Base URL

All API endpoints are accessible under the following base URL:

```
http://16.171.63.159/api/
```

Example endpoint:

```
GET /api/players/
```

Full request example:

```
http://16.171.63.159/api/players/
```

3. Authentication

Authentication is implemented using **Token Authentication**.

Users must first register an account and then obtain a token via the login endpoint.

Register

```
POST /api/auth/register/
```

Example request:

```
{
  "username": "user1",
  "email": "user@example.com",
  "password": "password123",
  "display_name": "User One",
  "bio": "Football fan",
  "favourite_team": 1
}
```

Successful response:

```
{
  "message": "User registered successfully",
  "token": "abc123...",
  "user": {
    "id": 1,
    "username": "user1"
  }
}
```

Login

```
POST /api/auth/login/
```

Example request:

```
{
  "username": "user1",
  "password": "password123"
}
```

Example response:

```
{
  "message": "Login successful",
  "token": "abc123...",
  "user": {
    "id": 1,
    "username": "user1",
    "email": "user@example.com"
  }
}
```

Using the token

Protected endpoints require the following header:

```
Authorization: Token <your_token>
```

Example:

```
Authorization: Token 9c8a1c3f2c...
```

Endpoints requiring authentication include:

- creating posts
- editing posts
- creating comments
- liking posts or comments
- deleting content
- deleting user accounts

4. Pagination

Many list endpoints use **pagination** to limit response size.

Example request:

```
GET /api/players/?page=2
```

Typical paginated response:

```
{
  "count": 100,
  "next": "http://example/api/players/?page=3",
  "previous": "http://example/api/players/?page=1",
  "results": [ ... ]
}
```

5. Filtering and Query Parameters

Several endpoints support filtering using query parameters.

Examples include:

Search players by name

```
GET /api/players/?name=Saka
```

Filter players by team

```
GET /api/players/?team_id=1
```

Filter matches by season

```
GET /api/matches/?season=2023
```

Analytics query

```
GET /api/analytics/top-scorers/?season=2023&limit=10
```

These query parameters allow flexible filtering of football statistics and analytics.

6. Error Handling

The API uses standard HTTP status codes to indicate success or failure.

Code	Meaning
200	OK
201	Created
204	No Content
400	Bad Request
401	Unauthorized
403	Forbidden
404	Not Found
429	Rate limit exceeded

Example Error Responses

400 – Bad Request

Returned when the request payload is invalid or missing required fields.

Example:

```
{
  "error": "Invalid request data"
}
```

Another possible example (validation error):

```
{
  "username": [
    "This field is required."
  ]
}
```

401 – Unauthorized

Returned when authentication credentials are missing or invalid.

Example:

```
{
  "detail": "Authentication credentials were not provided."
}
```

or

```
{
  "detail": "Invalid token."
}
```

404 – Not Found

Returned when a requested resource does not exist.

Example:

```
{
  "detail": "Not found."
}
```

7. API Specification

The following pages contain the **automatically generated OpenAPI specification** for the REST API.

This specification includes:

- endpoint definitions
- request parameters
- request body schemas
- response schemas
- example responses
- authentication requirements

The specification is generated directly from the Django REST Framework OpenAPI schema to ensure that the documentation accurately reflects the implemented API.

COMP3011-1 API (1.0.0)
